Simple solutions

Imagine, your [geo software](#) is missing crucial and for you important functions or components. There are two ways to handle it: You invest time and resources in the search for an all-embracing software that will ultimately offer you more than you need and you should be obliged to pay for.

Or you can develop a solution that exactly meets your requirements. This is our way. Tailored - for you.

“ We do not seek
a solution,
we develop it.

“ Technical knowledge, paired with a profound understanding of specialized procedures to be covered, leads to optimal results.

Jointly developed

Software is made by computer scientists.
But not by them alone!

The [software of GDV](#) is formed by the interdisciplinary interaction of geographers, geoinformatics and computer scientists. Technical knowledge is paired with profound insight into complex specialized procedures and together, solutions are well thought out and examined with regard to their usage and their application. This is the only way to create the best conditions for combining requirements and feasibility optimally. It goes without saying that we are familiar

with client and server-side, as well as mixed GIS architectures and geo-databases and that we select the appropriate technology according to where and how you use your applications.

This results in solutions that do exactly what the specialized procedures require and what you expect. That's why we speak of specialist applications and not just software and support you with advice and assistance around the underlying specialized procedures.

Tailor-made & efficient

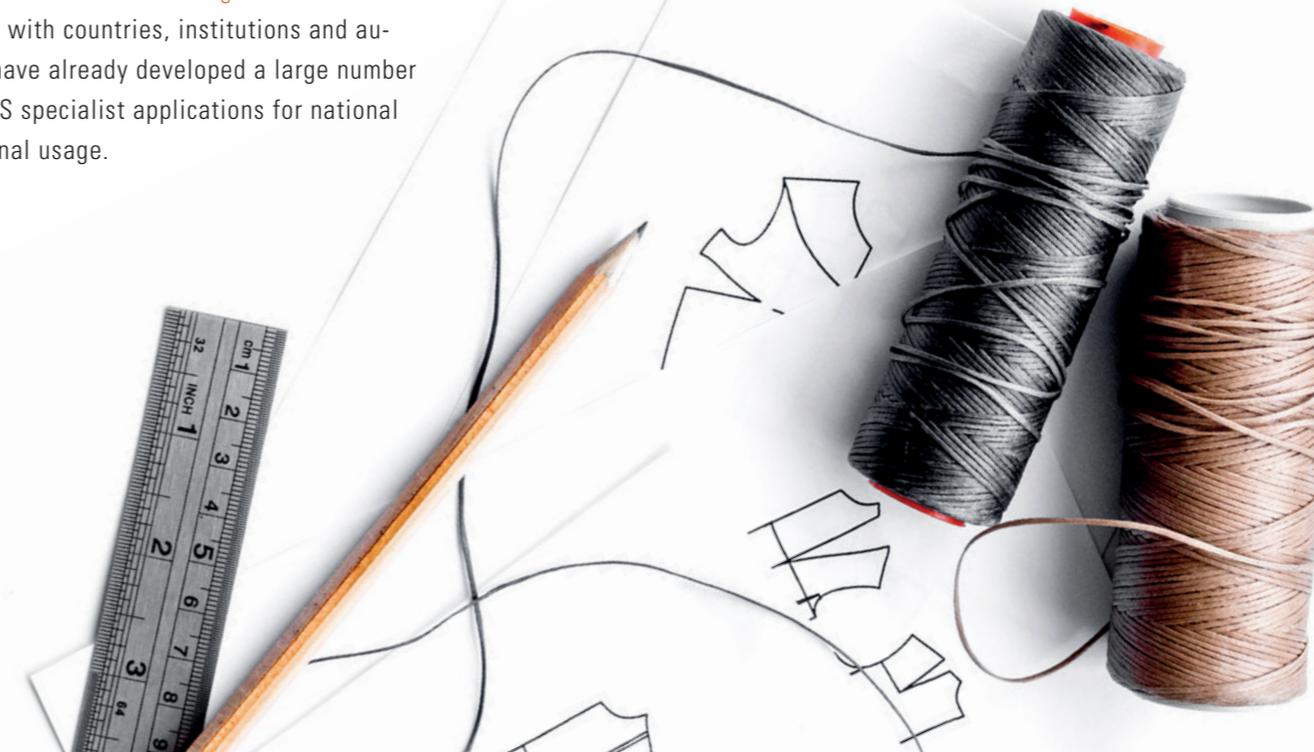

We integrate features and components you need into your specialized applications. Similar to a modular system, we start with a tried-and-tested basis and equip it with the necessary functionalities. This results in **individual solutions**, which we especially adjust to you and your geodata infrastructure.

For this we do not have to reinvent the wheel.

Benefit from our strength to incorporate experiences from each project into the next one as well as to use and apply tried-and-tested technologies.

In cooperation with countries, institutions and authorities, we have already developed a large number of different GIS specialist applications for national and international usage.

” We minimize complexity and maximize your efficiency.

Straightforward

across boundaries

Whether proprietary or open source - we are not only in both worlds at home, we also combine them. Paramount to us is software which optimizes and simplifies your work and decision-making processes. This includes the [platform-independent usage](#). Whether Linux, MAC OSX or Windows, with our software solutions you are independent. And that's not all. We develop powerful solutions that integrate easily into your IT environment today and adapt easily to new conditions tomorrow.

Because nothing develops as fast as the possibilities of the digital world.

“Whether open source or proprietary components, we are at home in both worlds and combine them.”

Surprisingly worthwhile

Become aware of the **unsuspected high potential** of digital spatial data. Take advantage of them! GIS or WebGIS solutions, specially adapted to your geodata infrastructure, take full advantage of this potential. You do not need mandatory GIS expertise. Our performances focus on the „simple“ user with easy to use software solutions with a manageable number of functionalities. Thus, work processes can be optimized and simplified. The results are significant savings over the long term.

Save your budget with attractive solution and license models of GDV.

„ Exploit the full potential of digital spatial data.
